What is QFontComboBox

The QFontComboBox widget is a combobox that lets the user select a font family, the combobox is populated with an alphabetized list of font family names, such as Arial, Helvetica, and Times New Roman. Family names are displayed using the actual font when possible. For fonts such as Symbol, where the name is not representable in the font itself, a sample of the font is displayed next to the family name. QFontComboBox is often used in toolbars, in conjunction with a QComboBox for controlling the font size and two QToolButtons for bold and italic.

There is a signal that is called `currentFontChanged()` in QFontComboBox class, When the user selects a new font, the `currentFontChanged()` signal is emitted in addition of `currentIndexChanged()`.
