What is QGridLayout

We have seen QHBoxLayout and QVBoxLayout examples, now let's talk about another type of layout, that is called QGridLayout, using QGridLayout we can align our widgets in row and columns.

- `addWidget()`: This method is used for adding widgets to the layout.
- `addLayout()`: This method is used for adding a specific layout to another layout.
- `addSpacing()`: This method is used for adding space from the right side.
- `addStretch()`: This method is used for stretching all the widgets in the grid layout.
